

To save an image in Photoshop, use File | Save. Coloring and painting The tool for creating new photographs is your computer's paintbrush and the software programs that combine these paintbrushes to create fabulous pictures. If you want a rainbow or want your face to have sun spots, a person with a paintbrush will do the job. You can start out by choosing a color, like blue, and then simply paint it on. If you want a more complex image, you can use many different types of brushes, including the Pencil, Brush, and Airbrush. You can also use these brushes to erase or draw something over the original image. You can also paint on an image using a paint bucket and paintbrush — or using a spray can and the spray tool. The Blur tool can be applied to images to soften the edges of an image. The Colors and Images menu is open by default; just click the Menu button (the first menu option on the far right) to open it. File management and storage Photoshop makes it easy to work with your files. You can store them, print them, or add them to web pages. Photoshop stores your images in a special folder, called the Photoshop image library. The default location for the image library is usually C:\Users\\AppData\Roaming\Adobe\Photoshop\12.0. You can choose which folders you want to store the files in and even configure that location in Photoshop itself. The folder called Store all files is used by default. Click Options in the main menu and select Preferences from the menu, and then scroll down to Folders. Choose the store all files option and click OK. Click the Back up Files button (next to the New button in the upper-right corner) to back up your files. When you first create a file, you are prompted to save the file on the same hard drive; the button now has a cross (two vertical lines) over it. Click OK to save the file. If you're creating a color profile, click the Convert to Profile button (or press Ctrl+I); do this on every image you create. The color profile is saved separately from the image itself. You can also store individual images in a separate folder called Crop on the hard drive or on the memory card in your camera. You can also have Photoshop store files in a folder called Shared. You

As you may know, if you have a subscription for Photoshop you can download it for free. Here are the minimum requirements for Photoshop: Mac or PC A multi-core processor 32 or 64 GB of RAM A monitor with at least a 1920x1080 screen A DVD drive or a USB stick with at least a 2GB capacity This is the minimum system requirement for an operating system: Mac OS X 10.5.8 or earlier Windows XP with Service Pack 3 or later Booting from an optical disc can be a bit tricky. If you want to keep your software license, you have to follow the official rules. Go to your Adobe Account at Photoshop.com to start. If you have not yet set up your Adobe Account, create one here: Adobe.com Sign In with your Current Password Enter New Password To keep your license active, keep your current software subscription and make

Q: Shake Tracking Android App How can I track user shaking in an Android app? I have an old app that had a constant stream of ActivityUpdates, but recently had a style update and now no longer receives any activity updates. I'm trying to keep the app from dying from not being on the phone, but the OS seems to not want to detect the Shake Sensor. A: This is only available in ICS. For earlier versions, you have to use the accelerometer, although there will be less precision. Add a MotionEventListener to your Activity, and filter the types of events you'll handle:

```
private final class MyMotionEventListener extends android.view.MotionEvent {
    @Override public boolean onTouchEvent(MotionEvent event) { if (event.getAction() == MotionEvent.ACTION_DOWN && event.getAction() != MotionEvent.ACTION_UP && event.getAction() != MotionEvent.ACTION_CANCEL) { return true; } return false; }
    @Override public boolean onKeyDown(int keyCode, KeyEvent event) { switch (keyCode) { case KeyEvent.KEYCODE_MISC: // do something return true; default: return super.onKeyDown(keyCode, event); } }
    @Override public boolean onKeyUp(int keyCode, KeyEvent event) { switch (keyCode) { case KeyEvent.KEYCODE_MISC: // do
```

1) Field of the Invention This invention relates generally to particle detectors, and more specifically to a novel particle detector in which the electrical pulses caused by an interaction of a particle with the detector are utilized to provide an indication of the type of particle being detected. In one aspect, the invention relates to a particle detector in which the pulses associated with a given particle are utilized to provide a qualitative result, i.e. a qualitative indication of the size and/or mass of the particles, in another aspect of the invention, the pulses provide a quantitative result, i.e. a quantitative indication of the size and/or mass of the particles. 2) Description of Related Art There are a number of types of particle detectors that are available commercially and known in the prior art. These include, for example, the avalanche photodiode detectors, the phosphor detectors, the MCA detectors, the ion chambers, and the number of thinned, semi-conductor detectors such as the SCINT 2.8 detector which is described in the brochure entitled "SCINT 2.8" from the Radiation & Electron Physics Division of the EID, Rev. 0, 1987. The SCINT 2.8 detector utilizes a semi-conductor detector, in the form of a thin layer of semi-conductor material, in conjunction with a DPD sensor. The DPD sensor, as described in U.S. Pat. No. 5,077,778 to Goffe and in U.S. Pat. No. 5,327,126 to Hirose et al., is an integrated circuit which responds to energy deposited in the thin layer of semi-conductor material to generate an output pulse which can be used to determine the kinetic energy of the interacting particle. The SCINT 2.8 detector was originally developed as a neutron detector. When a neutron strikes the thin layer of semi-conductor material of the SCINT 2.8 detector, a number of electrons are released as a result of the nuclear reaction of the neutrons with the semi-conductor material. These electrons are accelerated across the semi-conductor material and are captured by ionized atoms in the semi-conductor material. As a result, the electron/ion pairs are produced in the semi-conductor material. This subsequent multiplication of the electrons results in the production

of an electrical pulse signal in the output device of the detector. The SCINT 2.8 detector is a photosensitive detector which is a type of pulse
