The role of secretion in the maintenance of regulatory CD8+ T cells and the persistence of memory. The majority of memory T cells are generated in the absence of ongoing Ag exposure. Since the contraction and loss of memory cells occurs without Ag challenge, these cells are referred to as 'adaptive' memory cells. Recently, it has become apparent that the continuous secretion of specific cytokines is an important and general feature of adaptive immune responses and plays a critical role in the maintenance of both natural and adaptive memory cells. In this review, we will specifically focus on the T cell subset with regulatory capacity, which includes IL-10-producing CD4+ CD25+ Foxp3+ T cells and CD8+ T cell subsets producing IL-10, IFN-gamma and TGF-beta. We will discuss the question of whether or not cytokines need to be secreted to maintain adaptive CD8+ memory cells, and the mechanisms involved. We will also discuss the impact of the physiological role of adaptive memory cells in homeostasis. Progressive resistance exercise Progressive resistance exercise, also known as progressive overload exercise, is a form of strength training in which an individual increases the weights or repetitions performed until muscular fatigue occurs. This type of training is often used to increase strength and mass. Progressive resistance exercise is based on the principle that as muscles are overloaded, they grow stronger. Since the movement is guided by the individual, muscles can be strengthened without the risk of injury. Progressive resistance exercise is based on progressive overload, which is defined as the ratio of the increase in training load to the individual's strength level. The overload principle is key to 595f342e71
